

YLVÄ GABLER

You are haunted by the memory of your brother being struck by lightning while the two of you were climbing the church tower. You should have known better than to go along with such a reckless game! Since then you have had the Sight, as well as recurring bouts of severe headaches. You have devoted your life to understanding the nature of electricity.

You are at the National Archives to research how electric fields affect paranormal phenomena. The building was constructed to withstand fires. Its walls are supported by iron beams, and the heating is provided by modern cast-iron hot water radiators placed throughout the rooms. Ever since the National Archives were built, the place has been frequently haunted.

Your theory is that the structure of the building and its modern iron heaters form a kind of Faraday cage which, besides protecting the collections from lighting, also traps ghosts and spirits inside. You are now on your way to the Esoteric Section to take measurements with the electroscope you invented yourself.
